

# Vector Fields

## i) Definitions:

- A vector field on  $X$  is a Func : assigns  $\mathbb{R}^{n_X}$  to its corresponding tangent space  $T_x X$ .

## ① Vector fields:

i) For  $X = \cup_{\text{open}} \mathbb{R}^n$  :

$$\forall x \in X. T_x U \cong \mathbb{R}^n. \text{Def: } TU = \bigcup_{x \in U} T_x U \cong U \times \mathbb{R}^n.$$

$$\text{i.e. } TU = \{(x, v) \mid x \in U, v \in T_x U\}.$$

Canonical Proj :  $\pi : TU \rightarrow U. \pi^{-1}(x) = T_x U$ .

Def: Vector field  $s$  on  $U$  is :

$$s : U \longrightarrow TU = U \times \mathbb{R}^n. \quad \pi \circ s = \text{Id}_U.$$
$$x \longmapsto (x, \tilde{s}(x))$$

for some  $\tilde{s}|_x \in T_x U$ .

ii) For arbitrary  $n$ -dim manifold  $X$ :

$$TX = \bigcup_{x \in X} T_x X = \{(x, v) \mid v \in T_x X\}. \text{ tangent bundle of } X.$$

$$\pi : TX \rightarrow X. \quad \pi^{-1}(x) = T_x X. \quad \forall x \in X.$$
$$(x, v) \longmapsto x$$

Remark:  $TX$  may not be cross-product of  $X$  with

some other set.

It naturally has structure of manifold.

$$\text{S. } \dim(TX) = 2 \dim(X).$$

Def: Vector field on  $X$  is  $F_{\text{vec}}$ :

$$s: X \rightarrow TX, \quad \pi \circ s = I_X$$

② Smooth Structure:

i) For  $\tilde{U} \subseteq \mathbb{R}^n$ .  $\tilde{s}: \tilde{U} \rightarrow T\tilde{U}$ .

It's surely that  $\tilde{s}$  is smooth  $\Leftrightarrow$  the second component of  $\tilde{s}$  is smooth.

ii) For  $n$ -dim manifold  $X$ .  $(U, f) \in \mathcal{A}_X$ .  $s$  is vector field  
 $TU = \pi'(U) \subseteq TX$ . See it in chart by:

$$F: TU \xrightarrow{\sim} T\tilde{U} = \tilde{U} \times \mathbb{R}^n$$
$$(x, v) \mapsto (f(x), Af'(v))$$

$$\Rightarrow F \circ s|_U \circ f^{-1}: \tilde{U} \rightarrow T\tilde{U} \cong \tilde{U} \times \mathbb{R}^n$$
$$x \mapsto (f(x), Af \circ s|_x \circ f'(x))$$

i.e.  $F \circ s|_U \circ f^{-1} = (I_{\tilde{U}}, Af \circ s|_x \circ f')$   $\cong (I_{\tilde{U}}, \tilde{s})$

$$\tilde{s}: \tilde{U} \rightarrow \mathbb{R}^n$$

Remark: So  $TX$  locally looks like an open subset of  $\mathbb{R}^{2n}$ .

Def: A vector field  $s: X \rightarrow TX$  is smooth

if  $\forall (U, f) \in \mathcal{A}_X$ .  $F \circ s|_U \circ f^{-1} = (I_{\tilde{U}}, \tilde{s})$ :

$$\tilde{U} \rightarrow \tilde{U} \times \mathbb{R}^n, \text{ its } 2^{\text{nd}} \text{-component is smooth.}$$

Remark: It's indept with the choice of charts:

$$\text{For } \tilde{F}_1: F_1 \circ g|_{U_1} \circ f_1^{-1} = (I_{\tilde{U}}, \tilde{\gamma}_1) : \tilde{U} \rightarrow \tilde{U} \times \mathbb{R}^n$$

$$\tilde{F}_2: F_2 \circ g|_{U_2} \circ f_2^{-1} = (I_{\tilde{U}}, \tilde{\gamma}_2) : \tilde{U} \rightarrow \tilde{U} \times \mathbb{R}^n.$$

$U = U_1 \cap U_2$ . Next, we define:

$$\varphi_{21}: \tilde{U} \times \mathbb{R}^n \xrightarrow{\sim} \tilde{U} \times \mathbb{R}^n$$

$$(\tilde{x}, \tilde{v}) \mapsto (\varphi_{21}(\tilde{x}), D\varphi_{21}|_{\tilde{x}} \cdot \tilde{v})$$

$$\therefore \tilde{F}_2 = \varphi_{21} \circ \tilde{F}_1. \text{ Besides: } \tilde{\gamma}_2|_{\varphi_{21}(\tilde{x})} = D\varphi_{21}|_{\tilde{x}} \cdot \tilde{\gamma}_1|_{\tilde{x}}$$

## (2) Vector Fields from

### Translation Law:

Def:  $\mathcal{S}$  is a rule. st.  $\mathcal{S}: (U, f) \mapsto \tilde{\mathcal{S}}_f$ .  $\forall (U, f) \in A_X$ .

$\tilde{\mathcal{S}}_f: \tilde{U} \rightarrow \mathbb{R}^n$ . smooth. Besides.  $\forall (U_1, f_1), (U_2, f_2)$

$\in A_X$ .  $\forall \tilde{x} \in f_1(U_1 \cap U_2)$ .  $\tilde{\mathcal{S}}_2|_{\varphi_{21}(\tilde{x})} = D\varphi_{21}|_{\tilde{x}} \cdot \tilde{\mathcal{S}}_1|_{x_1}$

prop.  $\mathcal{S}$  defines a smooth vector field on  $X$ .

Pf: Restrict  $\mathcal{S}$  on  $A_X^*$ :

$\mathcal{S}_X = \mathcal{S}|_{A_X^*}: A_X^* \longrightarrow \mathbb{R}^n$  this is a tangent  
 $(U_X, f) \mapsto \tilde{\mathcal{S}}|_{f|_{U_X}}$  vector

$\therefore \hat{\mathcal{S}}: X \longrightarrow T_X$  is a smooth vector field.  
 $x \mapsto (\hat{x}, \mathcal{S}_x)$

since  $\tilde{\mathcal{S}}|_{f|_{U_X}}$  is smooth. & correspond  $\mathcal{S}|_X$ .  $(U_X, f)$

### (3) Flow:

① Def. A Flow on  $X$  is a smooth map:

$$F: (-\varepsilon, \varepsilon) \times X \rightarrow X \quad \text{Besides. } \forall s \in (-\varepsilon, \varepsilon), \text{ fixed.}$$

$F_s(x) : X \rightarrow X$  is  $C^{\infty}$ -diffeomorphism.  $F_0 = I_X$ .

Remark:  $(-\varepsilon, \varepsilon) \times X$  is naturally a smooth manifold  
with dimension:  $\dim X + 1$ . A chart:  
 $(I \times F, (I \times F) \times U)$ .

e.g.  $F_s(x) : T' \rightarrow T'$  is flow of  $T'$ .  
 $x \mapsto [x+s]$

$\Rightarrow$  If we fix  $x \in X$ .  $F_x(s) : (-\varepsilon, \varepsilon) \rightarrow X$ .

$F_{x(0)} = F(0, x) = x$ . it's a curve through  $x$ .

repeat on all  $x \in X$ . We obtain a vector field

on  $X$ :  $\mathcal{G}^F : X \rightarrow (I_X \times \{F_{x(s)}\})_{x \in X}$ .

Remark: We can view vector field as the infinitesimal version of flow.

### ② Procedure in charts:

$$\tilde{F} = f \circ F \circ (I \times f)^{-1} = (\tilde{F}_1, \tilde{F}_2, \dots, \tilde{F}_n) : (-\varepsilon, \varepsilon) \times \tilde{U} \rightarrow \tilde{U}$$

and  $\tilde{F}(0, x) = I_{\tilde{U}}$ . The associated vector field is:

$$\tilde{\mathcal{G}}^F = \frac{\partial \tilde{F}}{\partial s} |_{s=0} = \left( \frac{\partial \tilde{F}_1}{\partial s} |_{s=0}, \dots, \frac{\partial \tilde{F}_n}{\partial s} |_{s=0} \right) : \tilde{U} \rightarrow \mathbb{R}^n.$$

### ③ Existence:

If we have vector field  $\mathcal{G}$  on  $X$ . cpt manifold. Then we can find flow  $F$ . st.  $\mathcal{G}^F = \mathcal{G}$ . If  $X$  is noncpt.  $\varepsilon$  may be  $\rightarrow \infty$ .
