

# Preliminaries.

## (1) Holomorphic Functions:

i) For  $f(z)$  on  $\mathbb{C}$ ,  $f(z) = u(z) + i v(z)$ .

With norm  $|f| = (u^2 + v^2)^{\frac{1}{2}}$

ii) Actually,  $(\mathbb{R}^2, J) \cong \mathbb{C}$ , where  $J$  is

the complex structure:  $\mathbb{R}^2 \xrightarrow{J} \mathbb{R}^2$ , one-to-one.

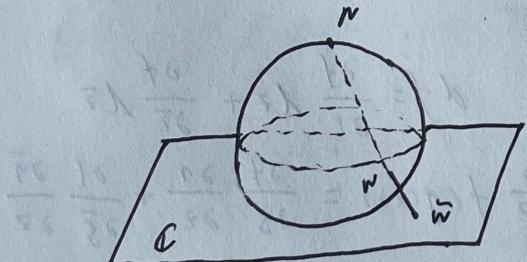

$J = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}$ . Define  $iz = Jx$ ,  $x \in \mathbb{R}^2$ .

Note that  $J^2 = -id$

Then  $u(z) \triangleq u(x, y)$ , when  $z = x + yi$ .

iii) Geometrically,  $\mathbb{C} \cong S^2 / \{\text{N}\}$ , where  $S^2$

is Riemann Sphere.

Note that  $C$  is a  
LCH space. Then we can  
use one-point-completion

$$\textcircled{1} \quad \overline{V(\infty)} = \overline{\mathbb{D}_{\infty}}$$

Then  $S^2 \xrightarrow{f} \overline{\mathbb{D}_{\infty}} \cong \mathbb{C}(\mathbb{P}')$

where  $f$  is stereographic projection  $f: w \mapsto \bar{w}$ .

## (2) Continuity and Differentiability:

i)  $f(z) = u + iv$  is conti  $\Leftrightarrow u, v$  conti.

L.T.:  $\arg(fz)$  conti. on  $\mathbb{C}/\{z \leq 0\}$ .

ii) If  $f(z)$  is differentiable at  $z_0 = x_0 + iy_0$ .

Then it's necessary that: for  $h = h_r + ih_i$ ,

$$\lim_{\substack{h \rightarrow 0 \\ h_r \neq 0 \\ h_i \rightarrow 0}} \frac{f(z_0 + h) - f(z_0)}{h} = \lim_{\substack{h \rightarrow 0 \\ h_r = 0 \\ h_i \rightarrow 0}} \frac{f(z_0 + h) - f(z_0)}{h} \quad \frac{\partial u}{\partial x} = \frac{\partial v}{\partial r}$$

$$\text{i.e. } \frac{\partial f}{\partial z} = \frac{1}{i} \frac{\partial f}{\partial \eta}. \text{ we obtain: } \frac{\partial u}{\partial \eta} = - \frac{\partial v}{\partial x}$$

called Cauchy-Riemann Equation

Def:  $\frac{\partial}{\partial z} = \frac{1}{2} \left( \frac{\partial}{\partial x} + \frac{1}{i} \frac{\partial}{\partial y} \right), \frac{\partial}{\partial \bar{z}} = \frac{1}{2} \left( \frac{\partial}{\partial x} - \frac{1}{i} \frac{\partial}{\partial y} \right)$

Remark:  $\Delta = \frac{\partial^2}{\partial z \partial \bar{z}}$  = Laplace Operator

Def:  $f'(z_0) = \frac{\partial f}{\partial z} \mid_{z=z_0}$

Remark: We have  $df = \frac{\partial f}{\partial z} dz + \frac{\partial f}{\partial \bar{z}} d\bar{z}$ .

Then  $\frac{\partial}{\partial z} f(g(z)) = \frac{\partial f}{\partial g} \frac{\partial g}{\partial z} + \frac{\partial f}{\partial \bar{g}} \frac{\partial \bar{g}}{\partial z}$

When  $f$  is differentiable,  $f$  is derivable.

Thn.  $f$  is derivable at  $z_0 \Leftrightarrow u, v$  are differentiable at  $z_0$ . satisfies Cauchy-Riemann Equation.

Remark: Derivability is concerning local of one dimension.  $f(z)$  may be derivable on a line: e.g.  $x^2$  if

Pf: For  $u, v$  are differentiable. Then:

$$f(z) = \frac{\partial f}{\partial z}(z - z_0) + \frac{\partial f}{\partial \bar{z}}(\overline{z - z_0}) + f(z_0) + o(z - z_0)$$

Thm.  $f$  is holomorphic in  $D \subseteq \mathbb{C}$ .  $\Leftrightarrow$

$u, v \in C^1(D)$ . satisfies C-R equation.

Remark: Holomorphic (Analytic) is defined in an open neighbour. If  $f$  is derivable in  $D \Rightarrow f \in \theta(D)$ . (holomorphic)  
i.e. Holomorphic is two-dimensional local

Cor.  $f \in \theta(D) \Leftrightarrow u, v \in C^1(D), \frac{\partial f}{\partial \bar{z}} = 0, \forall z \in D$

Pf: Since  $u, v$  satisfies C-R equation

$$\Leftrightarrow \frac{\partial f}{\partial \bar{z}} = 0, \forall z \in D.$$

Prop. If  $\operatorname{Re} f$  or  $\operatorname{Im} f$  or  $|f| = \text{const.}$  Then  $f \equiv \text{const.}$  when  $f \in \theta(D), \forall z \in D$ .

→ Alternative:  
open map Thm.

Pf: By C-R equation. The first two ✓

$$\text{And } \frac{\partial f \bar{f}}{\partial z} = \frac{\partial |f|^2}{\partial z} = 0 \quad \therefore \frac{\partial f}{\partial z} f = 0.$$

Cor.  $f: D \rightarrow \mathbb{R}, f \in \theta(D), D \subseteq \mathbb{C}$ . Then  $f \equiv \text{const.}$

## (2) Elementary Complex Func:

### ① Univariate Functions:

$$\text{Ex. } e^z = e^{x+iy} = e^x (\cos y + i \sin y)$$

$$\text{Ex. } \cos z = \frac{e^{iz} + e^{-iz}}{2}, \quad \sin z = \frac{e^{iz} - e^{-iz}}{2i}$$

Remark:  $e^z, \cos z, \sin z \in \theta(1)$ . There're unbounded. But the limit doesn't exist when  $z \rightarrow \infty$ .

They're well-def univariate Func.

$$\underline{\text{prop.}} \quad e^{z_1} \cdot e^{z_2} = e^{z_1 + z_2}, \quad \cos^2 z + \sin^2 z = 1$$

### ② Multivariate Functions:

#### i) $\operatorname{Arg} z$ :

$$\text{Ex. } \operatorname{Arg}(cz) = \operatorname{arg}(cz) + 2k\pi = \operatorname{arg}\left(\frac{c}{z}\right) + 2k\pi.$$

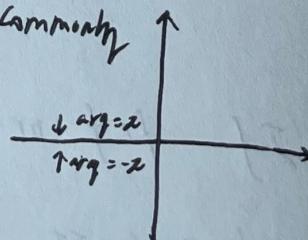

where  $k \in \mathbb{Z}$ ,  $z = x+iy$ ,  $\operatorname{arg}(z) \in [-\pi, \pi]$

$\operatorname{arg}(z)$  is define commonly

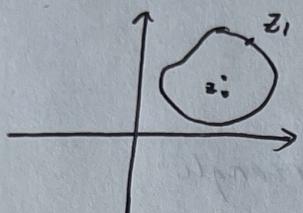

on  $\mathbb{C}/\{z \leq 0\}$ .

$$\lim_{\substack{z \rightarrow 0 \\ y \rightarrow 1^+}} \operatorname{arg}(z) = \pi$$

$$\lim_{\substack{z \rightarrow 0 \\ y \rightarrow -1^-}} \operatorname{arg}(z) = -\pi$$

Def: If  $f(z)$  move on a curve contouring the point  $z_0$ , one whole circle. Suppose it starts at  $z_1$  with value  $w_0 = f(z_1)$

But the second time it's back to  $z_1$  with value  $w_1$ .  
 $w_0 \neq w_1$ . Then  $z_0$  is called a pivot of  $f(z)$ .

The line connects two pivot is called the parting line.

e.g. 0 and  $\infty$  are 2 pivots of  $\arg(z)$ .

### (B) $\ln z$ :

$$\text{Def: } \ln z = \ln|z| + i\arg(z) + 2k\pi i, \quad k \in \mathbb{Z}.$$

$z=0, \infty$  is its pivot.

$$\text{prop. } \ln z^\alpha = \alpha \ln z \Leftrightarrow \alpha = \frac{1}{n}, n \in \mathbb{Z}.$$

### (1) $z^n$ cat $\theta/z$ :

$$\text{Def: } z^\alpha = e^{\alpha \ln z} = e^{\alpha(\ln|z| + i\arg(z) + 2k\pi i)}, \quad k \in \mathbb{Z}.$$

$z=0, \infty$  is its pivot.
